

# How to measure your windows for an estimate

Shutters are priced per square meter so we just need a rough width and height measurement of your window opening, in millimetres. Here are some quick guides explaining how to measure for different styles of windows, doors or shapes.

## Normal Windows

We consider a 'normal window' to be square or rectangular, set back within a recess with a window sill. We just need the overall width and height of this recess, so just measure from side to side and from the window sill to the top of the window.

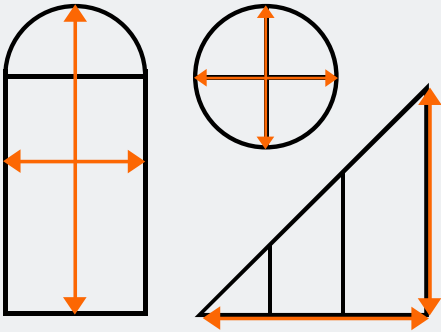

## Angled, Round or Square Bays

Measure the width of each angled bay section, either by running your tape measure around the whole bay, pushing it into each angle, or by measuring each angled section individually and adding these sizes together to make one width measurement. Just measure the height once from the sill to the top of the window.

**Next Step:** Once you have your sizes, enter them into our simple to use [online estimate form](#) for an instant price or call Gary on **01243 252023**

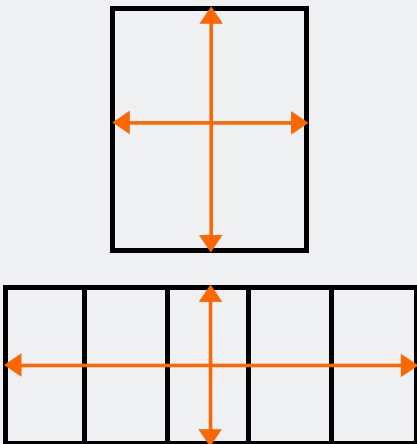

# How to measure your windows for an estimate

Shutters are priced per square meter so we just need a rough width and height measurement of your window opening, in millimetres. Here are some quick guides explaining how to measure for different styles of windows, doors or shapes.

## Shaped Windows

For shaped windows, measure the widest width and highest height of the opening that the window fits within. The final price will depend on the number of shaped panels there are within your shape (this will be finalised at your survey).

## Doors

Doors can be treated just like windows. Simply measure from one side to the other within the recess, and from the floor to the top of your door. Doorways over 2400mm wide may require a track. You can select a track option on our estimate, as this is an additional cost.
